“In late 2004, I purchased a directional FM antenna from PSI to install at a new station, KCVX, Salem, MO. The station calls for an ERP of 40 kW in the main lobe.

I selected PSI because of the economical cost and because of its reduced downward radiation. With the achieved gain of the antenna, I am able to run a TPO of just 6500 watts.

Installation was very easy, the instructions very, very clear to read, and the antenna went up in two days.

It has performed well in the past year, even during times when we were on backup power due to a tube socket failure.

PSI was easy to work with and delivered the finished antenna on time, which was good because we finished installation just two days before the CP expired.

I highly recommend this company.”
